FOREWORD

The I. C. A. R. has adopted the 'Coordinated approach' to crop improvement as its strategy in agricultural research. This approach is based on the principle of giving high priority to problem solving research and for the purpose an intimate knowledge of research in progress and trends of results is very essential. To give impetus to this approach, I. C. A. R. started a scheme for collecting data of all field experiments conducted in the country. It was aimed at compilation of agronomic experiments in the country, with a view to indicate the gaps in the knowledge and to avoid duplication. The scheme entitled : "National Index of Field Experiments" is running under the Institute of Agricultural Research Statistics which has rendered a very valuable service by preparing compendia of agricultural field experiments conducted in the country. Two series of the compendia containing results of about 7,200 and 12,000 experiments conducted during the period 1948-53 and 1954-59 respectively have already been published by the Institute. The present is the third series of compendia and is expected to contain the results of about 18,000 experiments conducted during the period 1960-65.

The number and the types of experiments have been increasing at a fast rate. Further many of the experiments were being repeated over a number of years. The conclusions drawn from such experiments should take into account the seasonal variations. For this purpose it was necessary to carry out consolidated analysis of results over years. Thus the task of compilation, analysis and interpretation of results of experiments being covered in the third series became more formidable compared to those covered in the earlier two series.

The preparation of this compendium has been possible by the whole-hearted cooperation of State Departments of Agriculture, Agricultural Universities and Central Research Institutes who ungrudgingly made the results of their experimental research available. My thanks are due to various officers of these institutions for participating in this work.

I hope that the present series will be followed by periodical publications of similar compendia for later years in order that the availability of results of scientific experiments in agriculture in India may be maintained up-to-date in a consolidated form.

PREFACE

The present set of volumes form Part III in the series of compendia of Agricultural Field Experiments being published under the project of National Index of Field Experiments. Volumes comprising in Parts I and II of the series pertaining to the periods 1948-53 and 1954-59 were published in 1962 and 1965 and contained the results of about 7,200 and 12,000 experiments respectively. The present volumes include results of experiments conducted during the period 1960-65. During the last one decade there has been an enormous increase in agricultural research and experimentation so much so that for the period 1960-65 to which the present volume refer, results of about 18,000 experiments are available.

Like the earlier two series, the compendium for Part III is divided into 15 volumes, one each for (1) Andhra Pradesh, (2) Assam, Manipur, Meghalaya, Arunachal, Nagaland, Mizoram and Tripura, (3) Bihar, (4) Gujarat, (5) Kerala, (6) Madhya Pradesh, (7) Maharashtra, (8) Mysore, (9) Orissa, (10) Punjab, Haryana, J & K and Himachal Pradesh, (11) Rajasthan, (12) Tamil Nadu, (13) Uttar Pradesh, (14) West Bengal and (15) All Central Institutes. A departure, has however, been made in presentation of the material contained in each volume. Whereas the results of individual experiments were presented in the volumes of previous series, the present series contains the results of pooled statistical analysis of experiments that were conducted for two or more years and concluded during the period 1960-65, in respect of those experiments conducted only for one year, and also those conducted for more than one year but were continuing beyond 1960-65, the results of individual experiments have been presented.

The work under the scheme was carried out at the Institute of Agricultural Research Statistics. As it was spread over a number of years there were changes in the officers responsible for the scheme. In successive stages, collection and analysis of data were carried out under the guidance of Shri T. P. Abraham, Assistant Statistical Adviser, now Joint Director, Central Statistical Organisation, Government of India, Dr. B. N. Tyagi, Senior Statistician, now Joint Director of Agriculture (Statistics), Uttar Pradesh and Shri M. G. Sardana, Senior Statistician, now Officer on-Special Duty, Central Statistical Organisation, Government of India. The final stage of analysis and the printing was carried out under the guidance of Shri K. S. Krishnan, Sr. Statistician of the Institute. At the preparatory stage the work of the third series of compendia was looked after by Shri O. P. Kathuria, Jr. Statistician, now Statistician in Indian Agricultural Research Institute. Subsequently, Shri R. K. Khosla, Jr. Statistician was responsible for the actual working of the scheme. Servashri P. P. Rao, S. N. Bajpai, M. P. Saksena, B. L. Chaudhary, M. L. Sahni, H. C. Jain, Mahesh Kumar, J. K. Kapoor, U. N. Dikshit, S. L. Garg, G. V. S. R. Krishna, G. L. Khurana, D. P. Singh, A. Lahari, Mahender Singh, S. S. Kutaula, Kuldip Singh and Suresh Chand Jain statistical staff of the Institute deserve special mention for their careful and painstaking work in the analysis of the data, combination of results of similar experiments and proof reading of the compendia volumes.

The collection of data of experiments from various research stations was done by the regional staff of the Institute placed in different States. They deserve to be congratulated for the hard work they have put in.

Thanks are due to the State Departments of Agriculture, the Central Institutes and the Agricultural Universities who made the data of the experiments conducted under their jurisdiction readily available to the staff of the Institute. The I. A. R. S. acknowledge with thanks this willing co-operation without which the consolidation of the results would not have been possible. The Institute is also thankful to various officers in the State Departments of Agriculture and Agricultural Universities who worked as regional supervisors for the project from

time to time and provided guidance to the regional staff working in the scheme. The list of the names of the regional supervisors and regional staff of the project is given on the following pages.

ABBREVIATIONS COMMON TO EXPERIMENTS ON ANNUAL AND PERENNIAL CROPS AND EXPERIMENTS ON CULTIVATORS' FIELDS GIVEN IN EXPERIMENTAL DATA

Crop :—In the top left corner is given the name of the crop on which the experiment is conducted. Within brackets along side the crop is mentioned the season wherever the information is available.

Ref :—Against the sub-title ‘Reference’ is mentioned the name of the State, the year in which the experiment is conducted and the serial number of the experiment for that year are given in brackets.

Abbreviations adopted for States are as follows :

1. A.P.	—	Andhra Pradesh	11. Ms.	—	Mysore
2. As.	—	Assam	12. N.L.	—	Nagaland
3. Bh.	—	Bihar	13. Or.	—	Orissa
4. Gj.	—	Gujarat	14. Pb.	—	Punjab
5. H.P.	—	Himachal Pradesh	15. Rj.	—	Rajasthan
6. Hr.	—	Haryana	16. T.N.	—	Tamil Nadu
7. J.K.	—	Jammu & Kashmir	17. Tr.	—	Tripura
8. K.	—	Kerala	18. U.P.	—	Uttar Pradesh
9. M.P.	—	Madhya Pradesh	19. W.B.	—	West Bengal.
10. Mh.	--	Maharashtra			

For the experiments conducted under the schemes sponsored by the Indian Council of Agricultural Research, like the All India Co-ordinated Agronomic Experiments (Model Agronomic Experiments and Simple Fertilizer Trials) scheme, no serial numbers have been given at the source as the data of these experiments were collected at the headquarters (New Delhi). In such cases the abbreviations MAE or SFT are given in the brackets against the year in which the experiment is conducted.

Site & Centre :—Name of the Research Station is mentioned along with the place where it is located, e.g. Agri. Res. Stn., Vyara for Agricultural Research Station, Vyara.

For Central Institutes, the corresponding standard abbreviations have been adopted as given below :

C. A. Z. R. I.	—	Central Arid Zone Research Institute.
C. P. C. R. I.	—	Central Plantation Crops Research Institute.
C. P. R. I.	—	Central Potato Research Institute.
C. R. R. I.	—	Central Rice Research Institute.
C. S. S. R. I.	—	Central Soil Salinity Research Institute.
C. T. C. R. I.	—	Central Tuber Crops Research Institute.
C. T. R. I.	—	Central Tobacco Research Institute.
C. T. R. L.	—	Cotton Technological Research Laboratory.
I. A. R. I.	—	Indian Agricultural Research Institute.
I. G. F. R. I.	—	Indian Grassland & Fodder Research Institute.
I. H. R.	—	Institute of Horticultural Research.
I. I. S. R.	—	Indian Institute of Sugarcane Research.
I. L. R. I.	—	Indian Lac Research Institute.
J. A. R. I.	—	Jute Agricultural Research Institute.
J. T. R. L.	—	Jute Technological Research Laboratory.
S. B. I.	—	Sugarcane Breeding Institute.

In case of the experiments conducted on cultivators’ fields, whether under an Indian Council of Agricultural Research scheme or by the State Government, the abbreviation (c. f.) is given along with the site or centre as, for example, Cuttack (c. f.).

Type :—Abbreviations used against this item are one, or more than one, of the following :

C—Cultural ; D—Control of Diseases and Pests ; I—Irrigational ; M—Manurial ; R—Rotational ; V—Varietal and X—Mixed cropping. In factorial experiments the treatments will be abbreviated as : for example Cultural-cum-Manurial as CM.

Object :—A statement of the objective of the experiment is given indicating the main crop and the type of the experiment.

Results :—Information under this heading should be read against the following items. :

(i) General mean. (ii) S. E. per plot. (iii) Results of test of significance. (iv) Summary table(s), with critical differences for individual effect means which are significant.

The information regarding the particulars of research stations may be obtained under the respective items as given below :

PARTICULARS OF RESEARCH STATIONS

A. General Information :

(i) District and the nearest railway station with Latitude, Longitude and Altitude, if available. General topography of the experimental area. (ii) Type of tract it represents. (iii) Year of establishment. (iv) Cropping pattern. (v) Programme of research.

B. Normal Rainfall :

Average fortnightly rainfall, specifying the period on which the figures are based.

C. Irrigation and drainage facilities :

(i) (a) Whether available ; if so, since when (b) Type of facilities available. (ii) Whether there is a proper drainage system.

D. Soil type and Soil analysis :

(i) Broad soil type with depth, colour and structure etc. (ii) Chemical analysis. (iii) Mechanical analysis.

E. No. of Experiments :

No. of experiments conducted on different crops that have been included in the compendium.

Information under the following heads is to be read against the respective items under experimental data as given on next page.

*A. For experiments on annual crops :**Basal conditions :*

(i) (a) Crop rotation followed, if any. (b) Previous crop. (c) Manuring of previous crop. (State amount and kind). (ii) Soil type. (iii) Date of sowing/planting. (iv) Cultural practices : (a) Preparatory cultivation. (b) Method of sowing. (c) Seed rate. (d) Spacing. (e) No. of seedlings per hole. (v) Basal manuring given to the whole experiment with time and method of application. (vi) Variety (indicate also early, medium or late). (vii) Irrigated or un-irrigated. (viii) Important Post-sowing/planting cultural operations such as weeding, etc. (ix) Rainfall during crop season. (x) Date of harvest.

B. For experiments on perennial crops :

(i) Previous history of the experimental area (Give manuring and other operations). (ii) (a) Soil type (b) Analytical results of soil, if available. (iii) Method of propagation of plants. (iv) Variety. (v) Date and method of sowing/planting (including spacing) (vi) Age of seedlings at the time of planting. (vii) Basal manuring given to the whole experimental area. (viii) Important cultural operations during the experimental year. (ix) Inter-cropping, if any. (x) Irrigated or un irrigated (if irrigated, give the source, number, interval and intensity of irrigation). (xi) Rainfall during the experimental year. (xii) Date(s) of harvest.

C. For experiments on cultivators' fields :

(i) (a) Crop rotation followed, if any. (b) Previous crop. (c) Manuring of previous crop (State amount and kind). (ii) Soil type and soil analysis, if available. (iii) Basal manuring (Give time and method of application). (iv) Variety. (v) Cultural Practices : (a) Preparatory cultivation. (b) Method of sowing. (c) Seed rate. (d) Spacing. (e) No. of seedlings per hole. (vi) Date of sowing/planting. (vii) Irrigated or un-irrigated (viii) Important post-sowing/planting cultural operations such as weeding, etc. (ix) Rainfall during crop season. (x) Date of harvest.

DESIGN*A. For experiments on annual crops :*

(i) Abbreviations for designs : C. R. D.—Completely Randomised Design ; R. B. D.—Randomised Block Design ; L. Sq.—Latin Square ; Fact.—Factorial ; other designs and modifications of the above to be indicated in full. (indicate confounded effects, if any). (ii) (a) No. of plots per block (in a split-plot experiment, the number of main-plots per replication as well as the number of sub-plots per main-plot should be given). (b) Block dimensions. (iii) No. of replications. (iv) (a) Gross plot-size. (b) Net plot-size. (v) Border or guard rows kept. (vi) Whether treatments are randomised (independently in each block).

B. For experiments on perennial crops :

(i) Abbreviations for designs: C. R. D.—Completely Randomised Design ; R. B. D.—Randomised Block Design ; L. Sq.—Latin Square ; Fact.—Factorial ; other designs and modifications of the above to be indicated in full. (indicate confounded effects, if any) (ii) (a) No. of plots per block. (in split-plot experiments, the number of main-plots per replication as well as the number of sub-plots per main-plot should be given). (b) Block dimensions. (iii) No. of replications. (iv) (a) Net plot-size. (b) No. of trees per plot (In case of experiments on grasses give plot size). (v) Border or guard rows kept. (vi) Whether the treatments are randomised (independently in each block).

C. For experiments on cultivators' fields :

(i) Design with No. of plots/block and No. of replications. In split-plot experiments, the number of main-plots per replication as well as the number of sub-plots per main-plot should be given. (ii) Method of selection of sites with number and distribution of experiments. (iii) (a) Gross plot-size. (b) Net plot-size. (iv) Whether treatments are randomised (independently in each block).

GENERAL INFORMATION

A. For experiments on annual crops ; B. For experiments on perennial crops, and C. For experiments on cultivators' fields.

(i) General crop condition during growth (if lodged, state date of lodging). (ii) Incidence of pests and diseases and control measures taken if any. (iii) Type of quantitative observations taken. (iv) (a) If the experiment has continued for more than one year, indicate year of commencement and year of termination. (b) Whether treatments assigned to the same plots every year. (c) Reference to combined analysis, if any. (v) Other centres, if any, where the same experiment has been conducted with reference numbers, if any. (vi) Abnormal occurrences such as heavy rains, frost, storm, drought, etc. (vii) Any other important information.

ORISSA

(Salient features of experimentation)

The general information regarding the agro-climatic regions, extent of irrigation, normal cropping pattern, etc. of the State of Orissa has been given in the first and second parts of the National Index of Agricultural Field Experiments already published for the periods 1948-53 and 1954-59 respectively.

This volume includes the results of 315 experiments conducted during the period 1960-65, besides experiments belonging to All-India Co-ordinated Agronomic Experiments scheme of I.C.A.R., as against 207 experiments for the period 1954-59 and 84 experiments for the period 1948-53. The consolidated results of experiments conducted for more than one year and concluded during the period 1960-65, numbering 85, and forming 35 groups, have been presented in Table I below :

Also the results of experiments conducted for only one year during the period under report numbering 204 and also those of the experiments which are continued beyond 1965, numbering 26 and forming 17 groups, have been presented. The distribution of all experiments, according to crop and type of treatments, is furnished in Table 2 below :-

The principal crop of the State is Paddy. Pulses and Oilseeds are the other important crops. Ragi, Jute and Sugarcane are also grown in some parts of the State, but these occupy relatively small areas. The salient features of the experimentation on different crops are given on next page.

Paddy :— Paddy covers 4332* thousand hectares i.e. 58.2% of the total cropped area. 167 experiments were reported on paddy crop, of which 81 experiments were conducted under irrigated conditions. 117 experiments were laid out in Split-plot Design, 39 in Randomised Block Design and the remaining 11 experiments in Confounded Designs.

In 101 (MV) experiments having Manurial and Varietal treatment combinations, except in one case, Split-plot Design was used ; 83% of these were having 2 to 3 replications with sub-plot size upto 20 square metres. The maximum and the minimum number of varieties tried in these 101 experiments were 22 and 3 respectively. In about 58% of such experiments 5 to 10 varieties were tried. In 90% of experiments 0 level of Nitrogen was not tried. In a majority of the experiments 2 to 4 levels of Nitrogen ranging between 22 to 90 Kg/ha. of Nitrogen were tried as a factor. Only 8 experiments had levels of P_2O_5 as a factor, ranging between 0 and 45 Kg/ha. of P_2O_5 . No experiment was conducted with Potash as a factor.

In 63 experiments of M, C, CM, I, IM and D types 17, 13, 13 and 7 experiments were conducted with T_{90} , T_{1242} , T_{1244} and BAM-6 paddy varieties respectively. The remaining 13 experiments were conducted with 10 other varieties. Randomised Block Design, Split-plot Design and Confounded Designs were used in 38, 15 and 10 experiments respectively. In experiments with Randomised Block Design, treatments ranging between 2 and 18 were tried. In 18, 14, 3 and 3 of these experiments, 3, 4, 5 and 6 replications respectively were used. Of the 15 experiments with Split-plot design, 6, 3 and 6 were conducted with 2, 3 and 4 replications respectively. Single or 2 replications were used in the 10 experiments conducted with Confounded designs.

In 39 M type experiments, levels of Nitrogen were tried in a majority of the cases, followed by levels of P_2O_5 . Of these, in only 3 experiments levels of K_2O were tried. In 15 C CV, CM and CMV types of experiments weedings, methods of sowing and ploughing, dates of planting, seed rates, spacings, age and type of seedlings, etc. were used as treatments. Only 3 irrigational (I & IM types) experiments were conducted. Out of the 9 D type experiments, 5 related to use of insecticides and pesticides to control diseases and pests and 4 to the use of weedicides.

Sugarcane :— Sugarcane covers 40.4* thousand hectares i.e. 0.54% of the total cropped area. 35 experiments were reported on this crop, of which 34 were conducted under irrigated conditions. Co. 997, Co. 527, Co. 617 and Co. 881 were the main varieties used in these experiments. 15 and 9 experiments had manurial and cultural treatments respectively while 10 were of D type. 25, 6 and 4 experiments respectively were conducted in Randomised Block Designs, Split-plot designs and Confounded designs. In Randomised Block Design, 3 to 10 treatments were tried with 3 replications in 4 experiments, with 4 replications in 16 and with 5 replications in the remaining 5 experiments. In Split-plot design 3 to 4 replications were used. 3 experiments with Confounded design were unreplicated while one such had 3 replications.

In the manurial experiments, levels of Nitrogen ranged between 0 and 360 Kg/ha., levels of P_2O_5 between 0 and 180 Kg/ha. and levels of K_2O between 0 and 112 Kg/ha. Effects of lime and F.Y.M. at different levels were also investigated. In cultural experiments, methods and depths of planting, dates of planting, row spacings, seed rates, etc. were tested. In the D type of experiments, effects of insecticides and pesticides were tested. Efficacies of different weedicides for controlling weeds in Sugarcane were also determined.

Jute :— Jute covers 51.0* thousand hectares i.e. 0.68% of the total cropped area. 30 experiments were reported on this crop, of which 13 had manurial (M) treatments, 5 cultural (C) and 12 had combination of varietal and cultural (CV) treatments. 14, 10 and 6 experiments were conducted in Randomised Block Design, Split-plot Design and Confounded Designs respectively. Experiments in Randomised Block Design included 12 experiments with 4 repli-

cations and 2 with 5 replications. In Split-plot design 4 experiments had 3 replications and 6, 4 replications. The 6 experiments in Confounded designs were evenly divided between 2 and 3 replications. Out of 18 experiments of M and C types, 15 were conducted with variety J.R.C.-212 and 3 experiments with variety J.R.O.-632.

In manurial experiments doses of N ranged between 0 and 90 Kg/ha. and doses of P_2O_5 and K_2O between 0 and 45 Kg/ha. 5 experiments were conducted to study the effectiveness of foliar spray of Urea. In C and CV types, of experiments, sowing dates, dates and stages of harvesting were tried as treatments.

Potato :— Potato covers 29·6* thousand hectares, i.e. 0·40% of the total cropped area. 19 experiments were reported on this crop of which 12, 2, 1 and 4 were of M, C, IM and D types respectively.

Ragi :— Ragi covers 64·7* thousand hectares, i.e. 0·87% of the total cropped area, but only 15 experiments were reported on this crop. 2, 10 and 3 experiments were of M, MV, and CV types.

Maize :— Maize covers 21·6* thousand hectares, i.e. 0·29% of the total cropped area. 11 experiments including 4 of M type and 5 of D type were reported.

Oilseeds :— Different Oilseed crops cover in all 272·7* thousand hectares, i.e. 3·66% of the total cropped area, but relatively a few experiments have been conducted on these crops. Gingelly, Groundnut, Mustard and Linseed accounted for 5, 4, 2 and 1 experiments respectively.

Other crops :— 26 experiments were reported on other crops, of which 10, 9, 2 and 2 experiments were of R, M, CM and D types respectively. C, CV and IM types accounted for one experiment each. Four experiments on wheat, 3 on berseem and 2 experiments on bhindi were conducted. One experiment each was conducted on cotton, tobacco, onion, legumes, mossambique, guava and pineapple crops.

PARTICULARS OF RESEARCH STATIONS AND SOIL ANALYSIS

1. Rice Research Station, Berhampur.

A. General Information :

(i) In Ganjam district, 10 Km. from Berhampur R.S. (S.E. Rly.) with Lat. 19°5'N/ Long. 84°3'E/Alt. N.A. As for general topography, the research station has (a) high land depending on the vagaries of the monsoon and (b) low land—having-facilities. (ii) Coastal tract. (iii) Established in 1932. (iv) Ragi, Paddy, Mung. (v) Programme of Research : (a) Collection of indigenous and exotic types of paddy varieties. (b) Study of collected materials and evolution of suitable varieties of paddy and millets. (c) Intra indica crosses in paddy. (d) Japonica indica crosses in paddy. (e) Trials on standard varieties of paddy and millets to test their suitability in different zones. (f) To find out the high yielding varieties of paddy and millets. (g) Production of breeder seeds. (h) Miscellaneous :- Maintenance of genetic stock, selfing of released strains, observation of promising strains and fixed hybrids of paddy and millets.

B. Normal Rainfall :

Average annual rainfall : About 125 cm. (the period on which the figure is based is not available).

C. Irrigation and Drainage facilities :

(i) Irrigation-4 ha. under canal irrigation during *kharif* season only. 8 ha. under rain-fed condition. A part of the high land is under tank irrigation. (ii) There is proper drainage system.

D. Soil type and Soil analysis :

(i) Broad soil type : Sandy loam.

(ii) Chemical analysis :

(a) Total Nitrogen (%):—0·032 to 0·088. (b) Available Phosphoric Acid :—30·4 to 57·6 Kg/ha. (c) Available Potash :—34·5 to 66·0 Kg/ha. (d) pH :—6·6 to 8·0.

(iii) Mechanical analysis.

(a) Sand (%) :—44·45 to 77·10. (b) Silt (%) :—7·00 to 19·10. (c) Clay (%) :—14·20 to 33·50. (d) Stones (%) :—1·5 to 11·0.

E. No. of Experiments.

Paddy—23 ; Total=23.

2. Agriculture Experimental Station, O.U.A.T., Bhubaneswar.

A. General Information :

(i) In Puri district, 5 Km. from Bhubaneswar R.S. with Lat. 20°—15' N/Long. 85°-52'E/ Alt. 25·9 m. above M.S.L. Most of the land is slopy, much of the soil is low lying, majority of high land have rocks below surface. (ii) Red alluvial tract (Portion of Eastern Ghat). (iii) Established in 1949. (iv) Normal cropping pattern is :— 1. Rice-Rice (very common) 2. Jute-Rice-Rice. 3. Rice-Potato-Groundnut. 4. Rice-Maize-Cowpea. 5. Rice-Vegetables-Vegetables. Other patterns are also followed, depending upon the type of land. (v) Applied research programmes mainly on rice in different aspects of agronomy, breeding, plant protection and soils are planned and conducted by concerned departments annually. In addition, horticultural research on fruits and vegetables are also conducted.

C. Irrigation and Drainage facilities :

(i) Perennial stream available from which 25% of the total area is irrigated.

(ii) Yes, there is proper drainage system.

D. Soil type and Soil analysis :

(i) Loamy sand to sandy clay loam, Depth—more than 2 m., Colour—varying from pale yellow to light red, Structure—Loose friable.

(ii) Chemical analysis : pH value varies from 5.2 to 6.7.

(iii) Mechanical analysis : Clay—9.7 to 27.8%, Silt—7.8 to 19.1%, Sand—32.6 to 58.0%.

(1) 3 levels of P_2O_5 : $P_0=0$, $P_1=22\cdot4$ and $P_2=44\cdot8$ Kg/ha.

(2) 3 sources of P_2O_5 : S_1 =Super, S_2 =Basic slag and S_3 =B.M.

3. DESIGN :

(i) Factor. in R.B.D. (ii) (a) 9. (b) N.A. (iii) 3. (iv) (a) 9·3 m. × 4·7 m. (b) 9·0 m. × 4·4 m. (v) 15 cm. × 15 cm. (vi) Yes.

4. GENERAL :

(i) Good for 62(5); Normal for others. (ii) Most of the spikelets were chaffy due to stem borer attack for 63(2); No incidence for others. (iii) Grain yield. (iv) (a) 1962 to 1964. (b) Yes. (c) Results of combined analysis given under 5. (v) N.A. (vi) Heavy rains damaged the crop for 63(2). (vii) Error variances are heterogeneous and Treatments × years interaction is present.

5. RESULTS :

(i) 1480 Kg/ha. (ii) 237·2 Kg/ha. (12 d.f. made up of various components of Treatments × years interaction). (iii) None of the effects is significant. (iv) Av. yield of grain in Kg/ha.

4. GENERAL :

(i) Normal. Lodging in some plots for 63(35) and 64(17). (ii) Attack of case worm, having caterpillars, Mealy bugs and stem borer for 60(24); No incidence for others. (iii) Grain yield (iv) (a) 1958 - 1964 (Expt. for 1961 is N.A. and Expt. for 1962 conducted with modified treatments). (b) No. (c) Results of combined analysis are presented under 5. (v) N.A. (vi) Nil. (viii) Results of expts. no. 58(19) and 59(8) have also been included for giving combined results. Error variances are heterogeneous and $(F \times P) \times$ years, $(F \times P) \times$ years and $(F \times K) \times$ years interactions are present.

5. RESULTS :

- (i) 2026 Kg/ha. (ii) 599.0 Kg/ha. (52 d.f. made up of various components of Treatments \times years interaction)
- (iii) Main effect of F alone is highly significant. (iv) Av. yield of grain in Kg/ha.

- (i) (a) Paddy-G.M. (b) G.M. (c) Nil. (ii) Clay to clay loam. (iii) 11.7.1962/17, 18.8.1962. (iv) (a) 4 ploughings each followed by pata. (b) Transplanted in lines. (c) 22.4 Kg/ha. (d) 15 cm.×23 cm. (e) 3. (v) Nil. (vi) T-141 (150 days). (vii) Irrigated. (viii) 2 weedings and 1 hoeing. (ix) 81 cm. (x) 1, 2.12.1962.

2. TREATMENTS :

All combinations of (1), (2) and (3)+an extra treatment

- (1) 3 levels of G.M. : G_0 =No G.M., G_1 =G.M. raised and ploughed in situ and G_2 =G.M. raised with application of 35 Kg/ha. of P_2O_5 and ploughed in situ.
 (2) 3 levels of N as A/S : $N_0=0$, $N_1=17.5$ and $N_2=35$ Kg/ha.
 (3) 3 levels of P_2O_5 as Super : $P_0=0$, $P_1=35$ and $P_2=70$ Kg/ha.

Extra treatment : T=NPK through artificial fertilizers equivalent to those obtained from G.M. N and P_2O_5 applied at final puddling. G.M. incorporated on 31.7.1962.

3. DESIGN :

- (i) 3³+1 confd. (ii) (a) 10 plots/block and 3 blocks/replication. (b) N.A. (iii) 2. (iv) (a) 11.9 m.×7.0 m. (b) 11.0 m.×6.4 m. (v) N.A. (vi) Yes.

4. GENERAL :

1. BASAL CONDITIONS :

(i) (a) Paddy-Paddy. (b) Paddy. (c) Nil. (ii) Clay loam. (iii) 5.6.63.16, 17.7.63. (iv) (a) 4 ploughings each followed by pata. (b) Transplanting. (c) N.A. (d) 23 cm. \times 15 cm. (e) 3. (v) Nil. (vi) T-141 (150 days) (vii) Unirrigated. (viii) 1 hoeing. (ix) N.A. (x) 2, 3.12.63

2. TREATMENTS :

All combinations of (1) and (2)+3 extra treatments

(1) 6 sources of micronutrients : S₁=Mn. Sul., S₂=Zn. Sul., S₃=Cu. Sul., S₄=Borax, S₅=Sodium Molyb. and S₆=S₁+S₂+S₃+S₄+S₅.

(2) 2 methods of application : M₁=Soil application and M₂=Foliar application.

Extra treatments : T₀=Control, T₁=35 Kg/ha. each of N, P₂O₅ and K₂O and T₂=Spartin at 395 Kg/ha. T₁ is also applied to 12 plots receiving micronutrients and to T₂ plot. Optimum dose of each micronutrient for the two methods has been tried. T₁ and T₂ applied to soil.

N applied as A/S, P₂O₅ as Super and K₂O as Mur. of Pot.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

(i) and (ii) The district has been divided into four agriculturally homogeneous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 3 on other half of type B on crop other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on Type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly blocked plots, in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/80 ac. (b) 1/40 ac. (iv) Yes.

(x) 23.10.61.

2. TREATMENTS :

Main-plot treatments :

3 levels of N as A/S : $N_1=22\cdot4$, $N_2=44\cdot8$ and $N_3=67\cdot2$ Kg/ha.

Sub-plot treatments :

7 varieties : $V_1=ADR-36$, $V_2=G-S-362$, $V_3=Co. 21$, $V_4=FH 42-12$, $V_5=FH 58-83$, $V_6=B-76$ and $V_7=J-16$.

N broadcast $\frac{1}{2}$ at planting, $\frac{1}{4}$ one month after planting and $\frac{1}{2}$ th, 15 days before flowering

3. DESIGN :

2. TREATMENTS :

Main-plot treatments :

3 levels of manures : L_1 =Basal dose (5000 Kg/ha. of F.Y.M.+35 Kg/ha. of N as C/A/N+25 Kg/ha. of P_2O_5 as Super, $L_2=L_1+17\cdot5$ Kg/ha. of N+25.0 Kg/ha. of $P_2O_5+35\cdot0$ Kg/ha. of K_2O and $L_3=L_1+35\cdot0$ Kg/ha. of N+50.0 Kg/ha. of $P_2O_5+70\cdot0$ Kg/ha. of K_2O .

Sub-plot treatments :

6 types of seedlings : $S_1=N$ armal, $S_2=1$, $S_3=2$, $S_4=4$, $S_5=6$ and $S_6=8$ splits. N as C.A.N., P_2O_5 as Super and K_2O as Mur. Pot. were applied. P_2O_5 and K_2O were given as basal dressing. $\frac{1}{2}$ N was applied at planting+ $\frac{1}{2}$ N one month after planting. The original seedlings from the nursery will be uprooted and split into two. (The clones of the seedlings will be separated out and will be again planted in the plots pertaining to the 1st Split treatment. The first splitting was done after 25 days from the date of sowing in the nursery. Again the seedlings which have been already split once and replanted again, they will be uprooted after 25 days and further split. This is known as second split. Subsequent splitting were done after 15, 10 and 9 days internal in case of four, six and eight splits. This progress will be done in the nursery only and seedlings related to 1st, 2nd splits etc. will be transplanted in the respective plots in the lay out.

N applied as A/S ; P₂O₅ as Super and K₂O as Mur. of Pot.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type—C trials three villages are randomly selected in each block.

(i) and (ii) The district has been divided into four agriculturally homogeneous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the other half of type B on crop other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on Type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/80 ac. (b) 1/40 ac. (iv) Yes.

Object : -To determine the optimum intensity and frequency of irrigation along with the optimum dose of N and P for Wheat crop.

1. BASAL CONDITIONS

(i) (a) Nil. (b) Sun hemp. (c) Nil. (ii) Sandy-loam. (iii) 20.11.60 and 2.12.60. (The plots were resown with N.P. 718 as the seeds sown on 20.11.60 did not germinate satisfactorily). (iv) (a) 3 ploughings followed by levelling and breaking of clods. (b) Line sowing. (c) 112 Kg/ha. (d) 23 cm. \times 23 cm. (e) N.A. (f) Nil. (g) N.P. 718 (medium). (h) Irrigated. (i) Nil. (j) 13 cm. (k) 26, 27.3.61.

2. TREATMENTS :**Main-plot treatments :**

All combinations of (1) and (2)

1. 3 intensities of irrigation : $I_1=2$, $I_2=3$ and $I_3=4$ acre inch.
2. 3 frequencies of irrigation : $F_1=3$, $F_2=4$ and $F_3=5$ irrigations.

Sub-plot treatments :

All combinations of (1) and (2)

1. 3 levels of N as A/S : $N_0=0$, $N_1=33.6$ and $N_2=67.2$ Kg/ha.
2. 3 levels of P_2O_5 as Super : $P_0=0$, $P_1=33.6$ and $P_2=67.2$ Kg/ha.

P_2O_5 was applied at the time of sowing on 19.11.1960.

3. DESIGN :

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a Kharif cereal, 3 on a Rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50—100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a *kharif* cereal, 3 on a *rabi* cereal, 3 on a cash crop and 2 on oilseed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

$n_1''' = 56$ Kg/ha. of N as C/A/N.

$n_2''' = 112$ Kg/ha. of N as C/A/N.

3. DESIGN :

(i) and (ii) The district has been divided into four agriculturally homogeneous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the other half of type B on crop other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on Type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1.80 ac. (b) 1/40 ac. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a Kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

3 DESIGN :

(i) and (ii) The district has been divided into four agriculturally homogenous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the other half of type B on crop other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on Type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/40 ac. (b) 1/80 ac. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50-100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block. Type A.

The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a legumeous crop. Half the number of trials conducted are of type A and the other half of type B on crop other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/40 ac. (b) 1/80 ac. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, 'soi', cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50—100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

(i) and (ii) The district has been divided into four agriculturally homogeneous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on *kharif* cereal, 8 on a *rabi* cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the other half of type B on crops other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/98.8 ha. (b) 1/197.6 ha. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50—100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 are of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a Kharif cereal, 3 on a Rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

3. DESIGN :

(i) and (ii) The district has been divided into four agriculturally homogeneous zones one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on *kharif* cereal, 8 on a *rabi* cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a legumenous crop. Half the number of trials conducted are of type A and the other half of type B on crops other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/98·8 ha. (b) 1/197·6 ha. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogeneous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50–100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a *kharif* cereal, 3 on a *rabi* cereal, 3 on a cash crop and 2 on oilseed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.

3. DESIGN :

(i) and (ii) The district has been divided into four agriculturally homogeneous zones and one field assistant posted in each zone. The field assistant conducts the trials in one revenue circle or thana in the zone and the circle/thana is changed once in two years within the same zone. Each field assistant is required to conduct 31 trials in a year, 8 on kharif cereal, 8 on a rabi cereal, 8 on cash crop, 4 on an oilseed crop and 3 on a leguminous crop. Half the number of trials conducted are of type A and the other half of type B on crops other than the legumes. The three trials on legumes are of type C. Residual effects of phosphate application are studied on Type C trials in two out of the four zones in each district every year. The experiments are laid out in randomly located fields in randomly selected villages in each of the 4 zones at the rate of one experiment per village. (iii) (a) 1/40 ac. (b) 1/80 ac. (iv) Yes.

3. DESIGN :

A selected district is divided into four agriculturally homogenous zones based on climate, soil, cropping pattern etc. In each zone one block is selected at random. A block normally consists of a group of 50 – 100 villages. In each block 36 experiments are conducted in a year of which 11 are of type A₁, 11 of type A₂, 11 of type A₃ and 3 are of type C. The eleven experiments under type A₁, A₂ and A₃ are distributed as 3 on a kharif cereal, 3 on a rabi cereal, 3 on a cash crop and 2 on oil seed. All the three type-C experiments are conducted on a legume crop. For the purpose of conducting the A₁, A₂ and A₃ experiments 11 villages are randomly selected in each block and in each village 3 experiments one, each of type A₁, A₂ and A₃ are laid out. For conducting the three type-C trials three villages are randomly selected in each block.
